

Granite Work Surfaces

Granite is the most popular and practical natural stone work surface available. With its huge range of colours and patterning, there will always be a granite colour that will enhance the look of any kitchen or bathroom. Granite is an igneous stone, and in many granites, the lava flow/direction can clearly be seen in the material. Mineral deposits denote the colours, and facets within the stone reflect the light as no other material can do. Granite blocks are quarried and then sliced and polished to the degree of polish required. They are often resined before polishing to fill any naturally occurring occlusions and enhance the colours and grain.

Granite Worktop Facts

- Staining: lighter untreated granites can be stained by red wine or oil splashes, while darker denser granites are much less prone to staining. Landford Stone treat all granite work surfaces with a proprietary sealant that will inhibit penetration by liquids that can stain the material. All polished natural stone surfaces are backed by a limited lifetime warranty. Although all honed, satinato and antique natural granite surfaces are treated, due to the nature of the materials with these finishes, the limited life time warranty is not provided.
- Heat Damage: granite is the most heat resistant natural material available for work surfaces, and only a naked flame or a red hot metal surface can damage a granite worktop.
- Other: we do not recommend chopping or cutting directly onto the granite work surface due to advances in modern knife manufacture. With vidiam tipped knives now being able to cut or scratch any surface from glass to limestone, we always recommend using a chopping board either in wood, toughened glass or acrylic.
- Chipping edges: please take care when removing heavy pots, pans or plates from the dishwasher. If the edge of the base is hit against the top edge of the worktop with force, it can chip the edge which will necessitate a chargeable repair visit.
